SCIENCE FOR SUSTAINABILITY

ILLUSTRATION: VU STRATEGIC PLAN, VISION 2015-2020

## The road to a sustainable and bustling VU Campus

Vrije Universiteit Amsterdam has a clear vision and strong set of ambitions in the field of sustainability. To achieve them, the VU grounds are undergoing a complete overhaul to create a new, green campus. The project has three strategic aims, one of which is to increase activity and enhance the quality of life on the university campus, where nearly 30,000 people come daily to work and study. This will encompass the development of a sustainable VU campus, contributing to sustainable area development, improving the natural environment and fostering a blend of residential facilities and urban amenities. So how will these plans take shape over the years ahead? Both Zuidas (architect) Franc van Nieuw and Facilities (FCO), who is also the newly appointed board member of the Green Business Club Zuidas.

### INCREASING ACCESSIBILITY

Years ago, VU's main building was located in the very heart of Amsterdam. But as the student body got bigger and space got tight, the university traded the city centre for a new campus on De Boelelaan in the 1960s. Up until around 2000, many people felt that the university was located on the fringes of the city. Franc says, 'But given the pace of city development since then, we now find ourselves back in the thick of the urban structure.'

We couldn't be happier, but it also made us realise that we had to think about transitioning from what used to be a relatively closed and largely independent campus to one that's far more integrated with the area and everything that is happening here. We want to make ourselves more visible to the outside world and increase our accessibility, both on and in the future. Lots of people simply pass by the campus, but everyone is welcome to use our facilities or grab a coffee here.'

Franc van Nieuw & Willem Verbeke

### A SUSTAINABLE CAMPUS

One step on the way to creating a sustainable campus for research and education was the foundation of the Green Office in October of last year. This is a sustainability platform run by and for students and staff who are committed to a greener, more eco-friendly university. It has already given rise to a number of fantastic sustainable projects, says Willem. 'For instance, Take Join The Pipe, an initiative to install drinking fountains all around the campus, where students can get drinking water and which has led to a drop in purchases of bottled water. Other examples are the creation of a rooftop garden and a recently unveiled charging point on the campus square, where people can charge their electronic devices using solar energy.'

'We feel we're an integral part of Zuidas.'

Water and energy are two key components of the plans for greening the VU campus. VU Amsterdam and VU Medical Center have also jointly signed a water storage and management agreement with Waterland. 'This comes out of our deep-seated awareness that as a major occupant in an area undergoing massive development, we have a serious responsibility to bear,' explains Franc. 'Besides, we're also renewing our energy master plan. That involves upgrading the capacity of the existing power station to generate renewable, affordable, sustainable and environmentally friendly on-campus energy supply for the next 15 years.'

### SUSTAINABLE AREA DEVELOPMENT

As well as creating a sustainable campus, VU Amsterdam is also keen to contribute to sustainable area development, as reflected by its recent signing of the Sustainability Amsterdam Statement of the Zuidas Green Business Club.

'Lots of people simply pass by, but everyone is welcome to use our facilities.'

'We're one of 25 organisations to have signed the statement, underscoring our commitment to sustainability efforts not only on campus, but across the entire Zuidas district,' explains Willem. 'We feel that we're an integral part of Zuidas and therefore also believe it's important to be an active local player. It's wonderful to be a part of the whole community here. Apart from the social dimension, our main concerns are mobility and the green quality of the area. Thousands and thousands of visitors come here every day, so it's crucial that transport to and from the area is structured as sustainably as possible. And we are also working actively on water storage. One concern is to prevent flooding during heavy downpours. These are responsibilities that we all share here in Zuidas.'

## CS Master – Track Software Engineering and Green IT

### HOW GREEN IS OUR DIGITAL SOCIETY?

Software-intensive systems support most if not all aspects of modern society. Processing power, data storage, network speed, and energy have become increasingly more powerful and less expensive. However, the energy necessary to keep them on and available is becoming scarce, and is a major global problem that all major nations aim at tackling aggressively. The time has come to build energy-aware software.

### PROGRAMME

This extended Master's track allows you to choose either to specialize in energy-aware software engineering, or address the general software engineering competencies while still creating awareness of the implications of software-intensive systems to the environment.

The programme provides both current professionals and future generations with the appropriate skills to build an

energy-aware digital society. It provides opportunities for inter-disciplinary assignments and projects addressing societal, business, technical and social aspects of energy-efficient and sustainable software systems. Selected industrial partners will offer innovative case studies and challenging projects.

### SELECTED COURSES

Service oriented design: it includes an industry-sponsored project in energy-aware software services (already active since three years, no change).  
Software metrics: provides the background on defining and applying software metrics to assess quality requirements of software in general, and energy efficiency and other sustainability-related qualities in the particular case of energy-aware software.  
Green Lab: will let students experiment with engineering energy-aware software-intensive systems, measuring, estimating, monitoring their energy consumption, and learning the energy impact of different software engineering practices and design decisions.

# What does “green software” mean?

Energy efficient

Energy aware

Sustainable

What does “green software” mean?

Myth: energy-efficient hardware will solve the issue

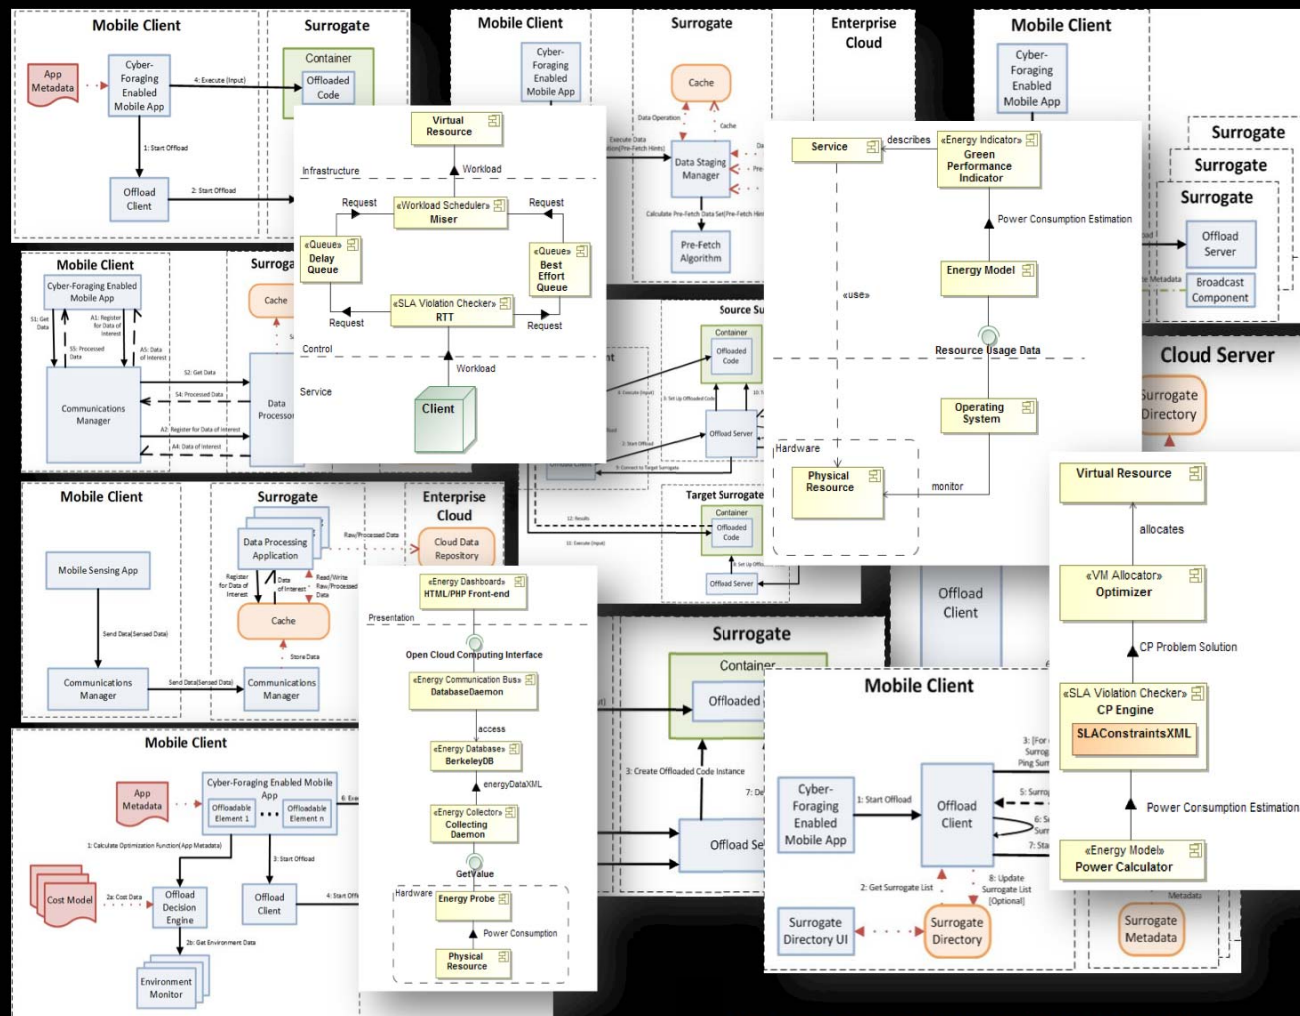

ID	Practice	Description	Category	Environment	Implementation	Energy Consumption Measures	Energy Impact
1	<i>Use efficient queries</i> 	complex queries can be performed to increase the responsiveness of the application at the expense of energy efficiency. Can be useful to avoid unnecessary "ORDER BY" or to use indexes.	Database	SEFLab	MySQL Server + Wikipedia DB, measure response time during query	System level, resource level incl. usage ratio, software execution measures (response time, number of request/query served)	-25% energy consumption
2	<i>Put application to sleep</i> 	in order to save energy the application can be put in sleep mode. An event, a signal, or an interrupt can resume the application.	Coding	SEFLab	Apache WebServer		-8,5% energy consumption
